

## Page 1 - The Lost Observatory

Arjun, a young astronomy student, discovered an old map hidden inside a library book. The map pointed toward a forgotten observatory in the Western Ghats. According to the notes, the observatory was built in 1894 by Professor Raman Iyer, a scientist known for tracking unusual meteor showers. Arjun decided to investigate during his summer break. Before leaving, he copied the coordinates written on the map: 14.9321 N, 74.1234 E.

## Page 2 - The Journal

Inside the observatory, Arjun found a leather journal belonging to Professor Raman Iyer. The journal revealed that a rare celestial event would occur on 17 August 2027. Raman believed the event would only be visible from the observatory's main dome. The journal also mentioned a brass telescope named 'Starlight-7', which had been specially calibrated to observe the phenomenon.

Arjun repaired the damaged telescope and waited for the predicted date. On 17 August 2027, he observed a brilliant meteor stream crossing the night sky. The event lasted 42 minutes and reached peak visibility at 10:18 PM. Arjun recorded the data and later published his findings in the Journal of Amateur Astronomy. His report attracted attention from researchers across India.

## **Page 4 - The Legacy**

Months later, the observatory was restored and reopened to the public. A new research center called the Raman Iyer Space Education Center was established nearby. Arjun became its first director. The restored observatory welcomed more than 12,000 visitors during its first year. A plaque at the entrance commemorated Professor Raman Iyer's contribution to astronomy and Arjun's efforts to preserve the site.
